

Es necesario entender la arquitectura como un dispositivo capaz de desplazar intermedias y tipo relaciones entre entidades existentes. Comprender el proceso constructivo más allá de un proceso de edificación, como un procedimiento de mediación técnica. Esta interpretación ofrece un criterio para el análisis de la arquitectura, que no es tanto inventar o inventar new formal or spatial resources for the discipline as an end in itself, but rather allowing other existing realities to be incorporated into its development. La arquitectura es una disciplina que se nutre de las realidades ecosistémicas, así la arquitectura sería el medio por el que, de una manera colaborativa, los agentes intervenientes materializan el (mejor) reensamblaje de sus redes.

Berrelatu trasciende los límites físicos del edificio preexistente, se plantea como una estrategia de transformación y reinventación del edificio a través de su ressignificación. Las características estructurales del antiguo edificio AIBE permiten leerlo como un soporte flexible con gran capacidad para experimentar nuevas tipologías capaces de abordar los desafíos globales del siglo XXI.

En este caso se interpreta como una infraestructura de depuración de agua tratada. En un momento en que los debates sobre energía son más pertinentes que nunca, el agua permanece en un segundo plano y, sin embargo, es importante en qué la producción, consumo y consumo moviliza nuestras sociedades. Berrelatu no solo transforma las metrópolis, sino que también nos enseña en forma más radical que cualquier otra fuente energética.

Participatory dialogue

Testing the possible uses of the new facility

Through light constructions of easy assembly/dismantling

It is necessary to understand architecture as a device capable of deploying mediations and creating relationships between existing entities. Understand the construction process beyond a building process, as a technical mediation procedure. This interpretation offers a criterion for the analysis of architecture, which is not so much inventing or inventing new formal or spatial resources for the discipline as an end in itself, but rather allowing other existing realities to be incorporated into its development. Architecture is a discipline that feeds on ecosystemic realities, thus architecture would be the means by which, if in a collaborative way, the agents involved materialize the (best) reassembly of their networks.

Berrelatu transcends the physical limits of the pre-existing building, it is considered as a protocol of action in obsolete industrial buildings through its ressignification. The structural characteristics of the old AIBE building allow it to be read as a flexible support with a great capacity to experiment with new typologies capable of addressing the global challenges of the 21st century.

In this case it is interpreted as an inhabited water purification infrastructure.

At a time when energy debates are more pertinent than ever, water remains the most important in which the production, consumption and consumption move our societies, shapes our metropolises and dramatically transforms our geographies, more radical than any other energy source.
