

Build on Otto Scheltus!

One of the greatest challenges architecture faces today is how to deal with the built environment and how to use it to address the crises our cities are already facing and will face in the near future. The competition entry “Build on Otto-Scheltus!” focuses on the reuse of a post-war modernist residential building. The entry is developed based on the principle of continuing the building. The design preserves and reinforces the architectural character of the existing structure while transforming it through carefully considered interventions into a sustainable, ecological, and socially resilient building that is viable for the future.
